AMENDMENTS TO THE SPECIFICATION:

Page 2, starting at line, please amend as follows:

Especially advantageously, the covering device is made from a flexible material which is

deployed or inflated in the mask interior under the influence of pressure. The air permeability of

the air-permeable material and the area of the portion defined thereby are selected such that a

sufficient outflow of gas from the mask interior is assured.

Page 6, paragraph starting at line 19, please amend as follows:

The covering device 2 is embodied such that in cooperation with the sealing lip device 1,

it defines a mask interior. The mask interior is in communication with a respiratory gas conduit

unit 3, for delivering respiratory gas to the mask interior defined by the covering device and

communicating with the nostril and/or the oral opening of the mask user. The covering device is

embodied in at least some portions as an air-permeable woven structure. The respiratory gas

conduit unit 3 forms a connection stub for coupling a respiratory gas hose. The respiratory mask

arrangement shown serves to deliver respiratory gas at a pressure level that is above the ambient

pressure. Under the influence of the pressure, the covering device 2 is deployed in the mask

interior between its peripheral attachment points, that is, between the sealing lip device 2 and the

respiratory gas conduit unit 3.

MADAUS et al. App. Ser. No. 10/563,857 January 19, 2010

The respiratory masks described can be secured by means of headband arrangements, e.g., headband 34 connecting to headgear connectors 35, as illustrated in Fig. 8b. These headband arrangements can be used to evacuate respiratory gas, because they may have airpermeable zones which communicate with the mask interior via a conduit.
